

Brief on TCS

Q1: What is the hiring process at TCS for B.Tech freshers in 2025-2026? Number of rounds, types, and tests."

A1: TCS fresher hiring in 2025–2026 is typically centered on NQT-based screening, followed by interviews for shortlisted candidates; updated fresher patterns commonly show a foundation round and an advanced round, then technical/HR evaluation depending on the role/profile.

A practical way to think about it is 3–4 stages: online aptitude/logic, coding or advanced technical test, technical interview, and HR or managerial round.

Typical rounds and what they test:

Online test / NQT foundation round: verbal ability, numerical ability, logical reasoning.

Advanced test: deeper aptitude, advanced reasoning, and coding/problem-solving.

Technical interview: core CS concepts, projects, coding basics, OOPs, DBMS, and sometimes DSA.

HR / managerial round: communication, availability, role fit, salary expectations, and background verification readiness.

Q2. "What is the technical stack TCS hires for in their 2025-2026 fresher batch? Languages, frameworks, clouds, databases."

A2: For fresher and entry-level roles, TCS commonly hires across Java, Python, C++, JavaScript, along with SQL/database fundamentals, HTML/CSS/JavaScript, and awareness of cloud platforms like AWS/Azure/GCP.

For more application-heavy roles, you'll also see Spring Boot, REST APIs, React, Angular, Node.js, .NET, MongoDB, Oracle, and microservices in current openings and job descriptions.

Most useful stack areas to prepare:

Backend: Java, Spring Boot, REST APIs, microservices.

Frontend: HTML, CSS, JavaScript, React, Angular.

Data and databases: SQL, Oracle, MongoDB, relational database basics.

Cloud and data engineering: AWS, Azure, PySpark, Databricks, GenAI/data-oriented tools for newer hiring needs.

Q3. "What recent news (2025-2026) is relevant for B.Tech students preparing to interview at TCS? Hiring numbers, pivots, layoffs."

A3: TCS has been in a restructuring phase, with reporting that the company reduced headcount by around 23,460 to 30,000 employees in FY26, while also saying the layoff cycle is concluding and campus hiring remains active.

At the same time, TCS leadership said they had already made about 25,000 campus offers in India and still aim to hire around 40,000 freshers annually, which means fresher intake continues despite the broader workforce reduction.

Why this matters for you:

Expect stricter filtering and stronger competition.

AI, cloud, and data skills are being emphasized more than before.

TCS is still hiring at scale, so campus-prep remains worthwhile for B.Tech students.

Q4. "What are the eligibility criteria at TCS for B.Tech 2026 placement — CGPA cutoff, branches, backlogs policy, package range?"

A4: For TCS NQT-style fresher hiring, the commonly reported criteria are B.Tech/B.E. or equivalent from recognized institutions, 60% or equivalent CGPA across academics, and no active backlog/arrear at the time of selection.

The process also generally expects full-time courses only, with academic gaps usually capped, and branch eligibility is broad enough to include engineering streams rather than only CSE/IT.

Eligibility snapshot:

Degree: B.Tech/B.E. and related full-time degrees from recognized institutions.

CGPA/marks: typically 60% or equivalent CGPA in 10th, 12th, and graduation.

Backlogs: no active backlog/arrear during the selection process.

Branches: all engineering streams are often considered for NQT-based hiring, depending on role and drive.

Package range: public fresher listings and market posts commonly place TCS fresher pay around 3.36–7 LPA, though the exact CTC varies by role and program.

Q5. "What are 5 specific preparation tips for a B.Tech 3rd-year student targeting TCS placement? Concrete and actionable."

A5: Master aptitude first. TCS screening heavily depends on verbal, numerical, and logical reasoning, so practice timed questions daily.

Build one strong coding language. Java or Python is the safest choice, and you should be able to write loops, arrays, strings, functions, and basic OOPs confidently.

Prepare DBMS and SQL well. TCS roles frequently mention SQL, relational databases, and sometimes NoSQL, so practice joins, keys, normalization, and query writing.

Explain your projects clearly. Be ready to discuss architecture, challenges, tech stack, and what you personally built, especially if you used Spring Boot, React, APIs, or cloud.

Track current TCS hiring themes. Mention AI, cloud, data, and automation in your resume and interview answers if you have real project exposure, because recent TCS hiring signals these areas more strongly.
